An aerial photograph of an industrial facility, likely a refinery or chemical plant, featuring a large, dark, circular reservoir in the foreground. The facility includes various structures, pipes, and storage tanks, with a prominent white dome-shaped structure on the left. The background shows a cityscape with buildings and roads.

Carbon-13 Labeled Polycyclic Aromatic Hydrocarbon (PAH) Standards

Cambridge Isotope Laboratories, in cooperation with Cerilliant Corporation is pleased to offer Carbon-13 labeled Polycyclic Aromatic Hydrocarbons (PAHs), as a superior alternative to deuterated standards.

Although CIL has traditionally produced high-quality deuterated PAH analogs (pages 160-161), some analysts have observed back-exchange of proton for deuterium under harsh extraction conditions and in certain matrices. If precise quantitation is required, or complete recovery information is needed, the non-exchangeable Carbon-13 isotope label is the right standard to use.

Substituted Benzothiophenes

Substituted dibenzothiophenes, sulfur analogs of the chlorinated dibenzofurans, are of interest to analysts due to their remarkable similarities to the chlorinated dioxin class of compounds. A very high mass resolution is necessary to distinguish a chlorinated dibenzothiophene from a chlorinated dioxin. This fact, coupled with the lack of commercially available pure isomers of these sulfur-containing compounds, has led to some speculation that in certain cases, compounds being quantitated as dioxins were, in reality, dibenzothiophenes.
