Brominated Flame Retardant Standards and Standard Mixtures

Isotope Labeled Brominated Diphenyl Ether (BDE) Standards

Generally used as flame-retardants, Brominated Diphenyl Ethers (BDEs) have become chemicals of significant environmental concern. BDEs may be generally considered as persistent and highly lipophilic substances, similar to well known environmental contaminants such as polychlorinated biphenyls (PCBs).

In 1996 Cambridge Isotope Laboratories (CIL) first introduced Chlorinated and Brominated Diphenyl Ether analytical standards. Since then, additional studies in Europe, Canada, Japan, and the United States have significantly increased interest in these products, and enabled CIL to extend its Flame Retardant offerings.

Diphenyl ether (¹³C₁₂, 99%) (BDE-0)

¹³C Labeled and Unlabeled BDE Metabolites

OH-BDE

Brominated Flame Retardants (BFRs), and in particular, the widely-used class of Brominated Diphenyl Ethers (BDEs) have been the subject of extensive scrutiny in recent years by Toxicologists, Analytical Chemists, and Risk Assessors. Recently, researchers have suggested that BDE body burdens are not completely represented by measurements of BDEs in tissue or milk. Analytical data indicates that the liver hydrolyzes BDEs in its attempts to expel them. BDE toxicity is still being established, but there is a likelihood that BDE metabolites have similar or greater toxicity than the parent BDEs. CIL has been producing both unlabeled and ¹³C₁₂ Methoxy- and Hydroxy-BDEs. Please contact CIL or your CIL representative if you are interested in analyzing BDE Metabolites.
